

Graph

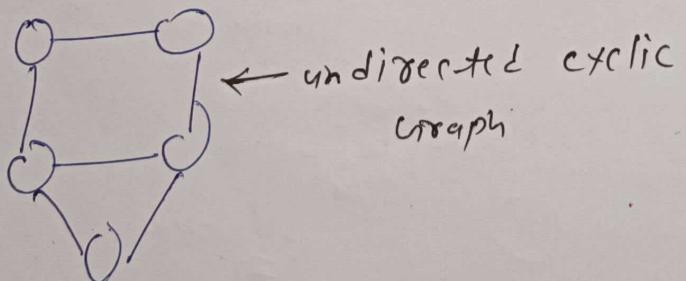

Introduction

Cycles in a Graph

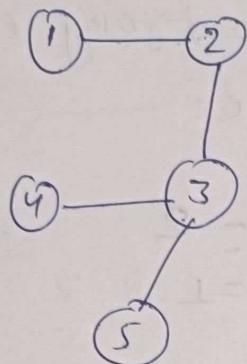

Start from a node & end at that node

Path

contain a lot of nodes/vertices & each of them are reachable.

path $\rightarrow 1 \ 2 \ 3 \ 5 \checkmark$

$1 \ 2 \ 3 \ 2 \ X$

Imp:- A node can't appear twice in a path.

$1 \ 3 \ 5 \ X$

adjacent node in path must have an edge b/w them.

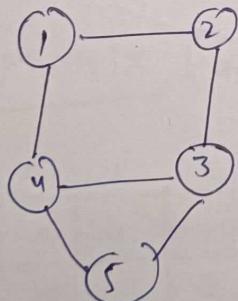

Ex- $1 \ 2 \ 3 \ 5$

$1 \ 2 \rightarrow$ edge \checkmark

$2 \ 3 \rightarrow$ edge \checkmark

$3 \ 5 \rightarrow$ edge \checkmark

Degrees in Graph -

$$D(3) = 3$$

$$D(4) = 2$$

for undirected graph the degree of node is equal to numbers of edges attached to it.

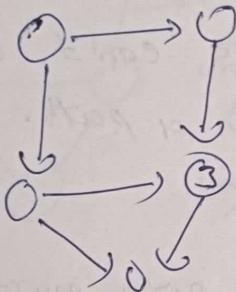

IMP

$$\boxed{\text{total degree of graph} = 2 \times E}$$

edges.

Directed graph

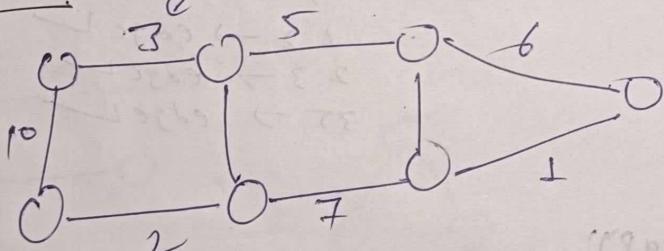

- (i) Indegree \rightarrow The number of incoming edges to that node
- (ii) outdegree \rightarrow The no. of outgoing edges to that node.

$$\text{Indegree}(3) = 2$$

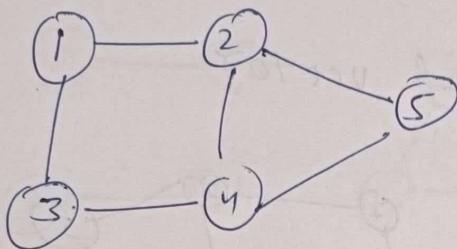

$$\text{outdegree}(3) = 1$$

edge weight

Graph Representation

Input

i/p

5	6
2	1
1	3
2	4
3	5
2	5
4	5

$n = 5$ $m = 6$
 ↓
 no. of nodes/vertices no. of edges in graph.

lines
↓
represent
edges

2	4
1	3
2	4
3	4
2	5
4	5

Store

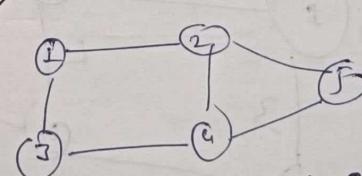

There are two ways to store a graph

(i) Matrix way

(ii) list way

(i) Matrix (adjacency matrix)

	0	1	2	3	4	5
0	0	0	0	0	0	0
1	0	0	1	1	0	0
2	0	1	0	0	1	0
3	0	1	0	0	1	1
4	0	0	1	1	0	1
5	0	0	0	1	1	0

edges

1	2
1	3
2	4
3	4
2	5
4	5

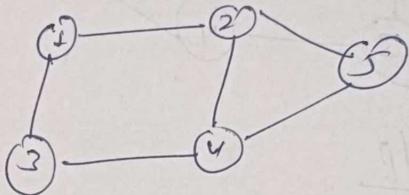

Space - $O(N \times N)$

(ii) List

vector $\langle \text{int} \rangle \text{ adj}[n+1]$

array of vector.

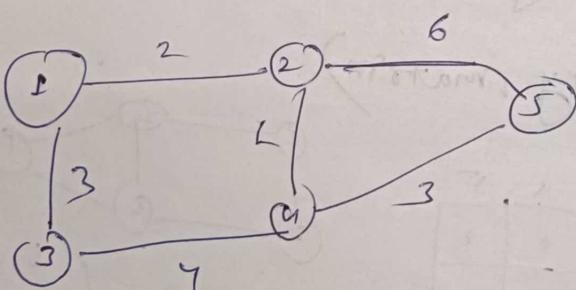

0 → 4
1 → 2, 3, 4
2 → 1, 4, 5, 4
3 → 2, 4, 4
4 → 3, 2, 5, 4
5 → 2, 4, 4

S.C. = $O(2^E)$

Directed graph → S.C. = $O(E)$

weighted graph

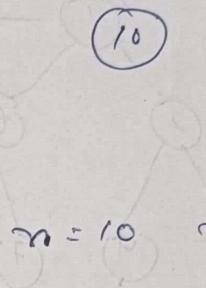

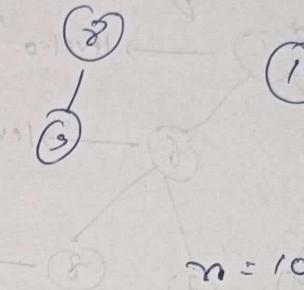

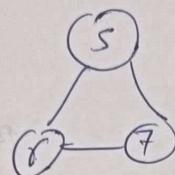

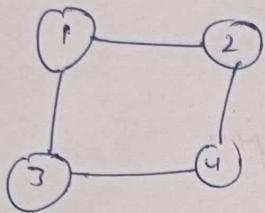

vector $\langle \text{pair} \langle \text{int}, \text{int} \rangle \rangle \text{ adj}[n+1]$

4 → 1(2, 4), (3, 4), (5, 3)

adj node weight.

Connected Components

4 different components of single graph

edges
1 2
1 3
2 4
3 4
5 6
5 7
6 7
7 9

so when we do traversal of graph then we always always used a visited array.

Vis =

1	1	1	-	0	0	0	0	0	0	0	0
0	1	2	-	1	2	3	4	5	6	7	8

 N=11

for (i = s → 10)

```
{ if ( !vis[i] )  
    traversal(i);  
}
```

4

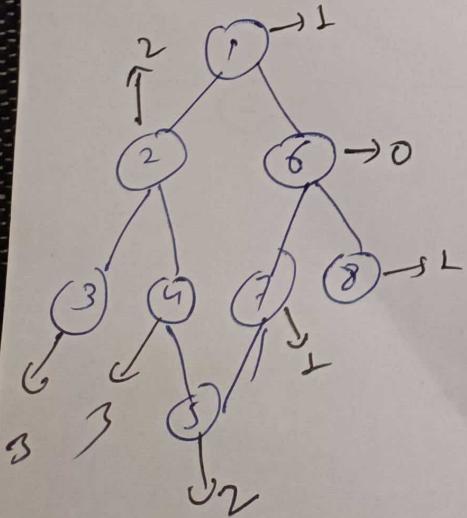

Breadth-First-Search Traversal

BFS Traversal $\rightarrow \underline{\underline{1}} \quad \underline{\underline{2}} \quad \underline{\underline{6}} \quad \underline{\underline{3}} \quad \underline{\underline{4}} \quad \underline{\underline{7}} \quad \underline{\underline{8}} \quad \underline{\underline{5}}$

Imp:- There can be multiple BFS traversal for a particular starting Node. Also if starting node changes DFS traversal also changes.

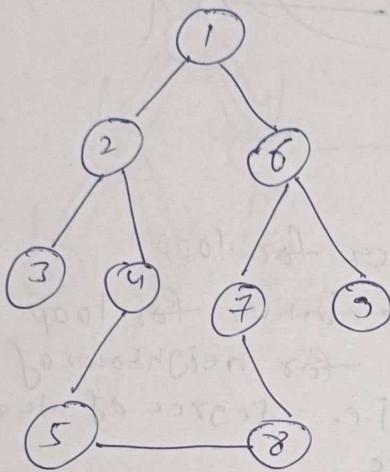

Starting node - 6

BFS Traversal

$\underline{\underline{6}} \quad \underline{\underline{1}} \quad \underline{\underline{7}} \quad \underline{\underline{8}} \quad \underline{\underline{5}} \quad \underline{\underline{3}} \quad \underline{\underline{4}}$

BFS Traversal

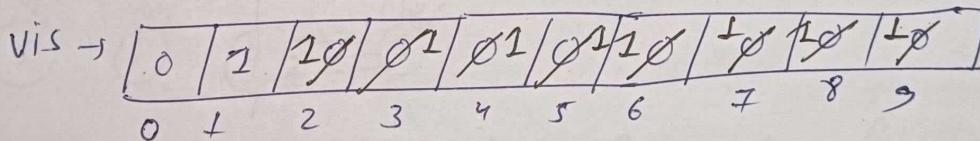

BFS $\rightarrow 1 \ 2 \ 6 \ 3 \ 4 \ 7 \ 9 \ 5 \ 8$

adj -

$1 \rightarrow \{2, 6\}$
 $2 \rightarrow \{1, 3, 4\}$
 $3 \rightarrow \{2\}$
 $4 \in \{2, 5\}$
 $5 \in \{4, 8\}$
 $6 \rightarrow \{1, 7, 9\}$
 $7 \rightarrow \{6, 8\}$
 $8 \rightarrow \{5, 6\}$
 $9 \rightarrow \{6\}$

~~8 pop 7~~
~~5 pop 8~~
~~5 pop 7~~
~~7 pop 6 & print 6~~
~~4 pop 5 & print 5~~
~~3 pop 4 & print 4~~
~~6 pop 3 & print 3~~
~~2 pop 2 & print 2~~
~~1 pop 1 & print 1~~

queue

Imp:- initially queue can contain only starting node = 1
 & when any node is visited or is inserted into queue mark as 1 in vis.

1st iteration of queue \rightarrow node = q.front() \rightarrow print(1)
 \rightarrow q.pop()

$$\text{adj}[1] = \{2, 6\}$$

insert (2, 6) into queue.

$$S.C. = O(3N)$$

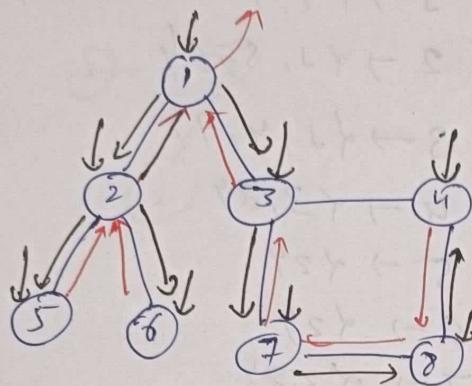

$$T.C. = O(N) + O(2E) \rightarrow O(N+E)$$

for queue

for inner for loop

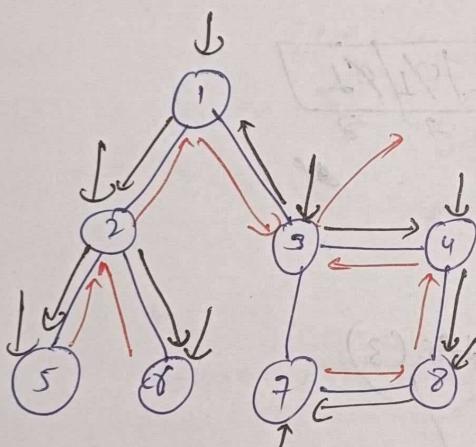

So the inner for loop
will run for neighbours of
a node i.e. degree of that
node
i.e. for all degree of
the graph

DFS Traversal in a Graph

Starting node = 1

DFS = 1 2 5 6 3 7 8 4

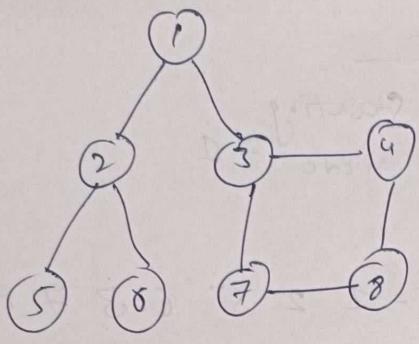

Starting node = 3

DFS = 3 4 8 7 1 2 6 5

⇒ Use Recursion for DFS:

```
for(int i=0; i<V; i++)
{
    if(!vis[i])
        DFS(i)
}
```

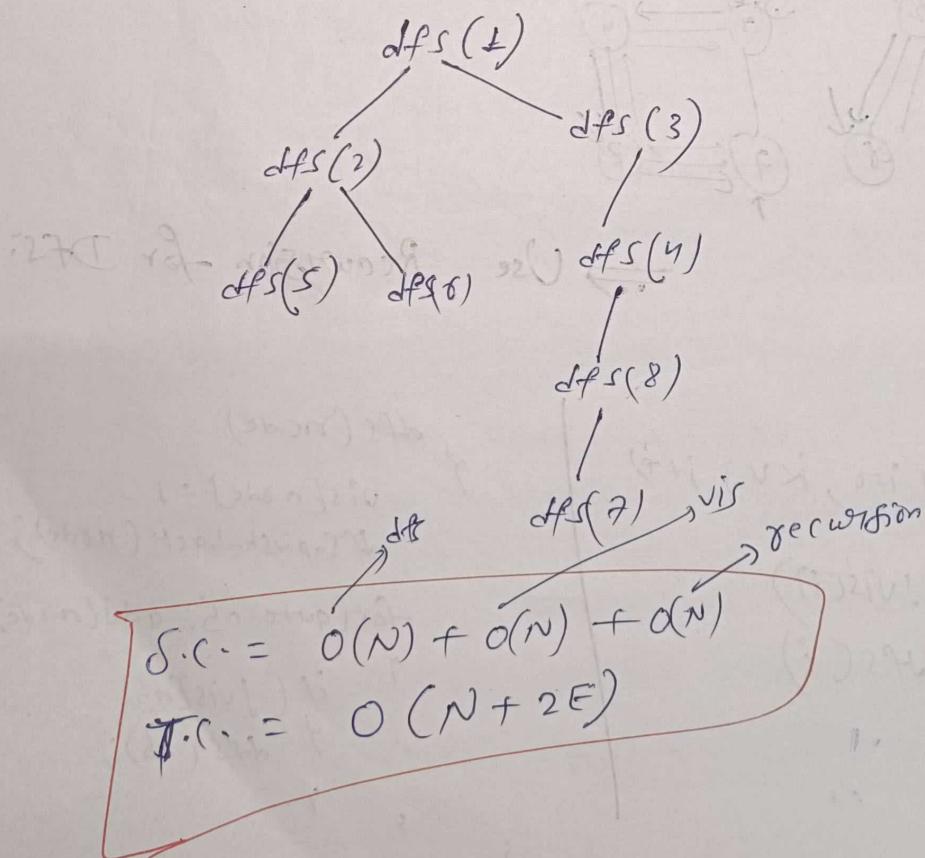

```
dfs(node)
vis[node] = 1
dfs.push-back(node);
for(auto nb: adj[node])
{
    if(!vis[nb])
        dfs(nb);
```

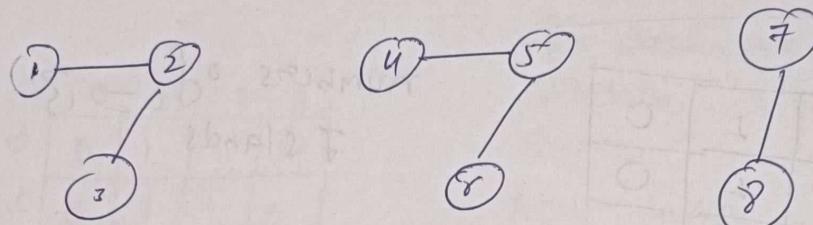

adj List

$1 \rightarrow \{2, 3\}$
 $2 \rightarrow \{1, 5, 6\}$
 $3 \rightarrow \{1, 4, 7\}$
 $4 \rightarrow \{3, 8\}$
 $5 \rightarrow \{2\}$
 $6 \rightarrow \{2\}$
 $7 \rightarrow \{3, 8\}$
 $8 \rightarrow \{4, 7\}$

$\text{vis} \rightarrow [0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8]$
 $0 \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8$
 $\text{dfs} = 1 \ 2 \ 5 \ 6 \ 3 \ 4 \ 8 \ 7$

Number of Provinces

```
for (i = 0; i <= v; i++)
```

```
    if (!vis[i])
```

```
        dfs(i)
```

```
        provinces++
```

```
return provinces;
```

$$S.C. = O(N) + O(N)$$

$$T.C. = O(N) + O(2^{\epsilon})$$

$$T.C. = O(N) + O(N + 2^{\epsilon})$$

for loop

dfs call

200. Number of Islands

ex

0	1	1	0
0	1	1	0
0	0	1	0
0	0	0	0
1	1	0	1

numbers of islands = 3

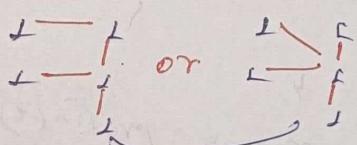

Intuition:-

How can we say that it is a graph?

Problem bcz it is a 2D matrix.

Try to think "as" a node

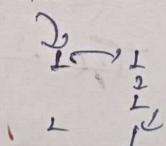

0	1	1	0
0	1	1	0
0	0	1	0
0	0	0	0
1	1	0	1

many ways these can be connected to each other

start from

so if I start a traversal from 1 then it will

make sure it will traverse the deepest 1 in all 8 direction so from 3 starting point we can traverse all the island.

→ There by there are 3 starting point

so 3 island

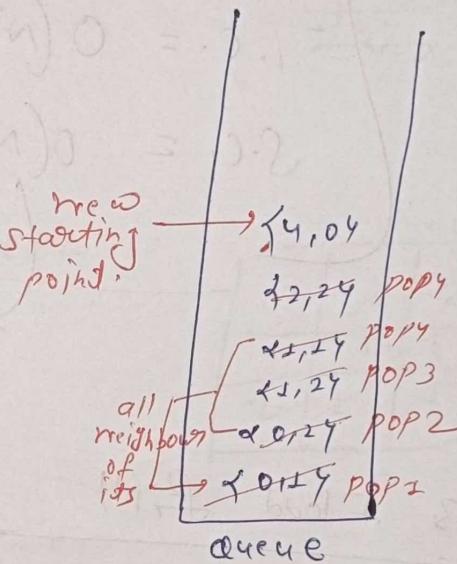

BFS Traversal

	0	1	2	3
0	0	1	1	0
1	0	1	1	0
2	0	0	1	0
3	0	0	0	0
4	1	1	1	1

	0	1	2	3
0		1	1	
1		1	1	
2			1	
3				
4				

vis.

for BFS we need a starting node into our queue.
 here take $\{0, 1\}$ as col.

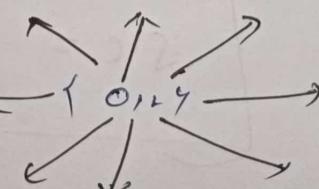

* Initially insert the starting node into queue & mark them as visited.

1-st iteration

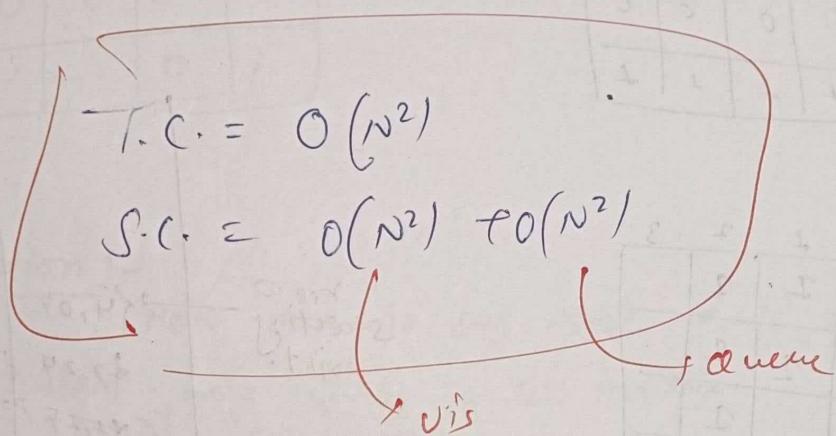

BFS said that while traversal pick up the element from queue & insert all its neighbours into queue.

node = $(0, 1)$
 neighbour \rightarrow

Q How to decide a starting point?

⇒ Traverses the matrix & if you find a land that is not visited then this is your starting point.

733 Flood Fill

Similar is above problem.

imp in the question they don't want you to do color in minimum time.

$$T.C. = O(NPM)$$

$$S.C. = O(PM) + \text{stack space}$$

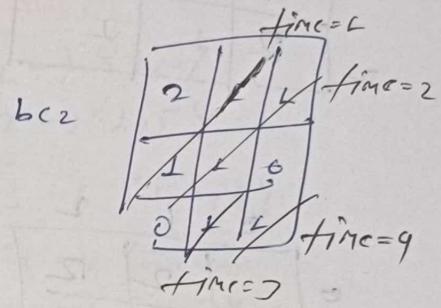

$\rightarrow O(NPM)$

~~733. Flood Fill~~

994. Rotting Oranges

2	1	1
1	1	0
0	1	1

time = 4

a	1	2
0	1	2
2	1	1

time = 1

0	1	2
1	2	3
2	3	4

1	2	1
1	1	0
0	0	1

time = 1

2	2	2
2	2	0
0	0	1

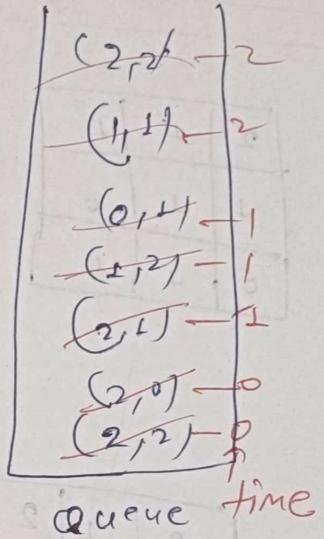

To solve this problem we use DFS

Algorithm & their can be many starting points.

	0	1	2
0	0	2	2
1	0	1	1
2	2	1	1

	0	1	2
0	0	2	2
1	2	2	2
2	2	2	2

vis

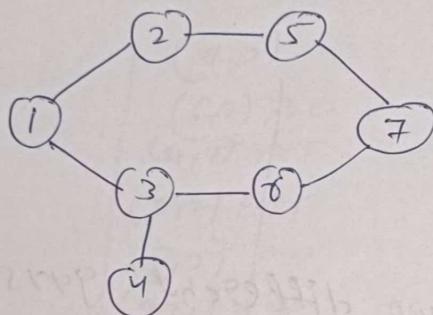

$$T.C. = O(n \times m) + O(n \times m \times y)$$

$$S.C. = O(n \times m)$$

Detect Cycle in a Undirected Graph

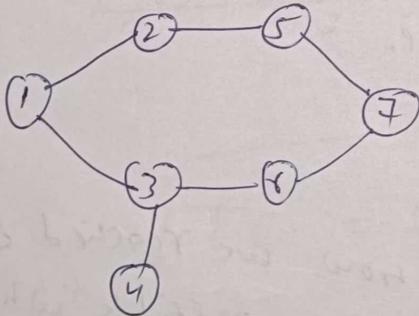

BFS

adj-list

1 → {2, 3, 4}
2 → {1, 5, 6}
3 → {1, 2, 4, 6, 7}
4 → {3, 5}
5 → {2, 7, 6}
6 → {3, 7, 4}
7 → {5, 6}

Intuition:-

BFS is a traversal technique now start from 1 & go level wise.

from 1 we can go → 2 & 3 at same time &
remember that you came from 2

Now from 2 you can go → 5 & 1 but you can't
go to 1 bcz you came from 1. so go at 5.

from 3 \rightarrow 6, 4, L but not go to
& bcz you came
from L

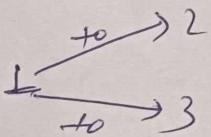

~~seen~~ 3 \rightarrow 6 & 4
8
2 \rightarrow 5

~~seen~~ from 5 \rightarrow {7} & 2*

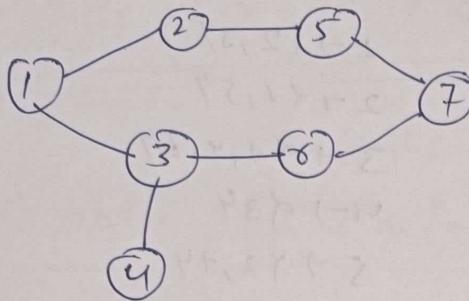

from 6 \rightarrow {7} & 3*

so from two different ways
5 & 6 we can go to 7 i.e. at
same place.

Imp from starting we are going in
different direction i.e.

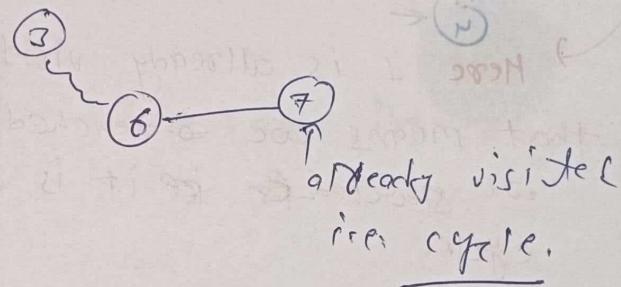

but somehow we reached same
place ~~is~~ it is only possible when
the graph is connected.

$1 \rightarrow \{2, 3\}$
 $2 \rightarrow \{1, 5\}$
 $3 \rightarrow \{1, 4, 6\}$
 $4 \rightarrow \{3\}$
 $5 \rightarrow \{2, 7\}$
 $6 \rightarrow \{3, 7\}$
 $7 \rightarrow \{5, 6\}$

(7, 5)
(6, 7) <i>pushes</i>
(1, 3) <i>pushes</i>
(5, 2) <i>pushes</i>
(3, 1) <i>pushes</i>
(2, 1) <i>pushes</i>
(1, -1) <i>pushes</i>

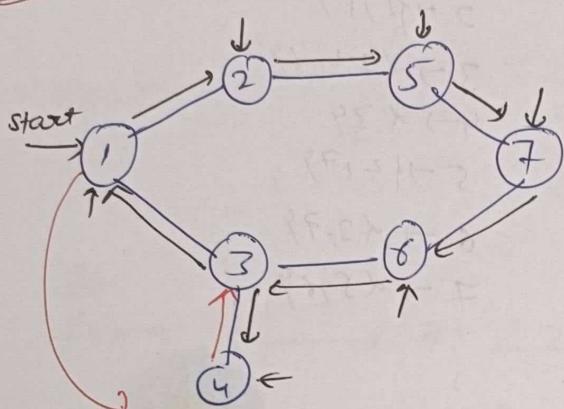

visit $\boxed{1 \ 0 \ 1 \ 2 \ 1 \ 3 \ 4 \ 5 \ 6 \ 7}$

$$\begin{array}{l}
 \text{T.C.} = O(N+2E) + O(N) \\
 \text{S.C.} = O(N) + O(N)
 \end{array}$$

BFS for loop of
DFT vis

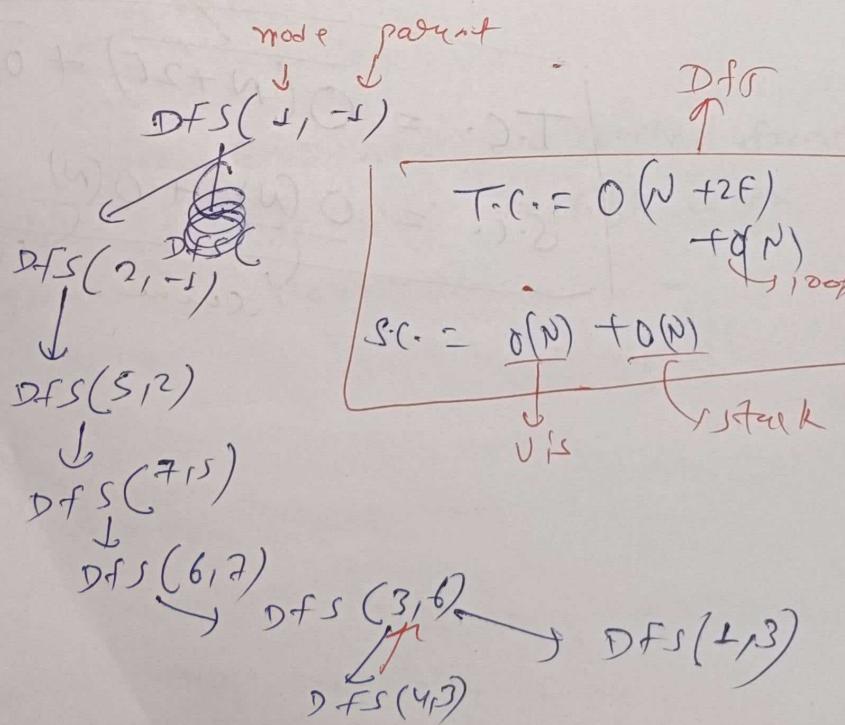

DFS

Here 1 is already visited
that means we reached at a point where
we started ~~or~~ & it is only possible in
cycle.

$1 \rightarrow 1, 2, 3, 4$
 $2 \rightarrow 2, 4, 5, 6$
 $3 \rightarrow 3, 4, 6, 7$
 $4 \rightarrow 4, 3, 5$
 $5 \rightarrow 5, 2, 7, 6$
 $6 \rightarrow 3, 7, 4$
 $7 \rightarrow 5, 6, 4$

vis = $\boxed{0 \ 1 \ 2 \ 3 \ 4 \ 5 \ 6 \ 7}$

Distance of nearest cell having 1

Number of Enclaves

0 → sea cell

1 → land cell

~~n × m~~ ← matrix

0	0	0	1
0	1	1	0
0	1	1	0
0	0	0	1
0	1	1	0

→ ans = 4

Return the number of land cell in grid
for which we can't walk off the boundary
of the grid in any number of moves.

⇒ call dfs/bfs for boundary cell fleet having
'1's' and mark visited ~~too~~ fleet all
cell which are connected to these.

$$T.C. = O(n \times m \times y)$$

$$S.C. = O(n \times m) + O(\max(n, m))$$

Number of Distinct Islands

	0	1	2	3	4
0	1 1	0	1 1		
1	1 0	0 0	0 0		
2	0 0 0	0	1		
3	1 1 0	1 1	3		

no. of islands = 4

distinct islands = 3

Intuition:

To solve this problem one thing which we can do is we can store the shape of Island into a set data structure bcz set always store the unique value.

→ How do we can store the shape?

Shape-1 $\{ (0,0), (0,1), (1,0) \} \rightarrow \{ (0,0), (0,1), (1,0) \}$

These are not same.

Shape-2 $\{ (2,3), (2,4) \} \rightarrow \{ (2,3), (2,4), (3,3) \}$

Shape-2

$$\begin{aligned} & (2,3) - (2,3) = (0,0) \\ & (2,4) - (2,3) = (0,1) \\ & (3,3) - (2,3) = (1,0) \end{aligned}$$

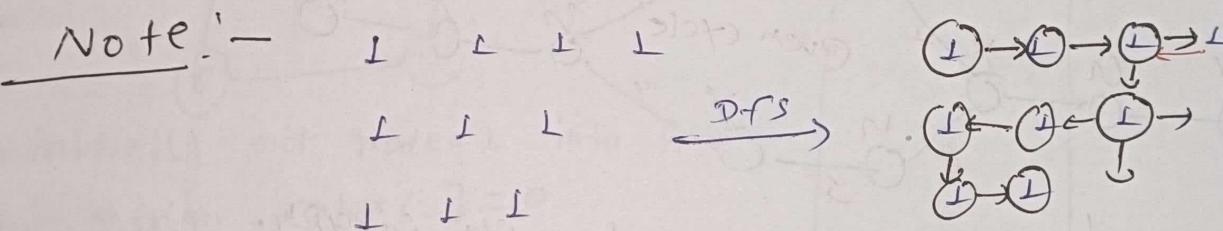

Base $\rightarrow (2,3)$

Now we can see $\rightarrow \{ (0,0), (0,1), (1,0) \}$

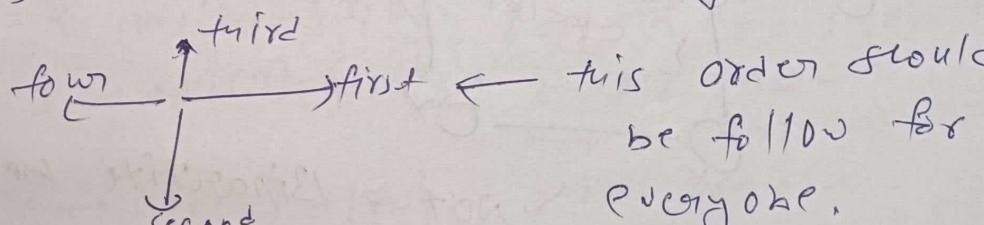

Shape \rightarrow 3 $(0,3)$ $(0,4)$ \rightarrow $(0,3) - (0,3) = (0,0)$
 $(0,4) - (0,3) = (0,1)$

Shape \rightarrow 4 $(1,0)$ $(1,1)$ \rightarrow $(1,0) - (1,0) = (0,0)$
 $(1,1) - (1,0) = (0,1)$

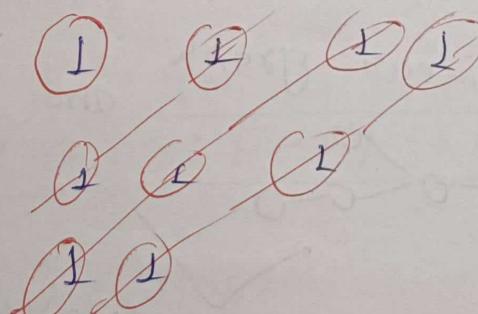

Same Shape

follow a particular order for entire
BFS / DFS traversal so that list contains
values in an order for every ISLAND.

i.e.  this order should
be follow for
everyone.

BFS

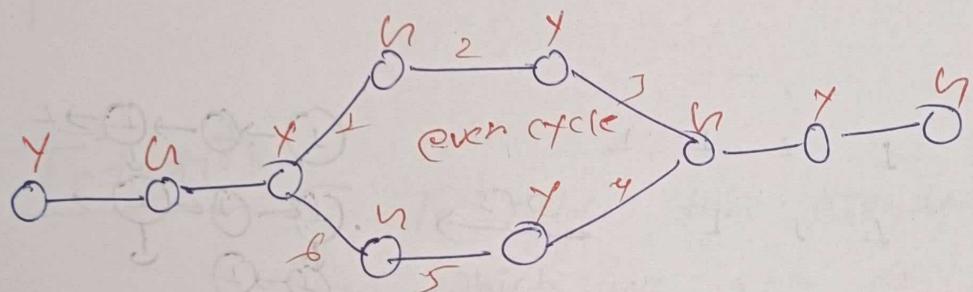

DFS

$T.C = O(n \times m \times 4)$
 100% $\rightarrow O(2^n \times m)$
 $S.C = O(2 \times n \times m)$
 set + vis

Bipartite Graph

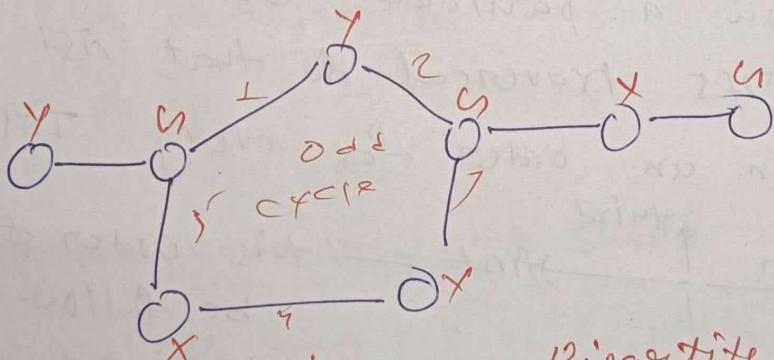

Bipartite Graph :- Colour the graph with 2 colours such that no adjacent nodes have same color.

ex color \rightarrow X/Y

↳ This is a Bipartite Graph.

ex

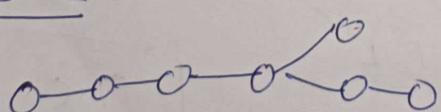

↳ NOT a Bipartite Graph

Note -

case-1 \rightarrow Linear graph

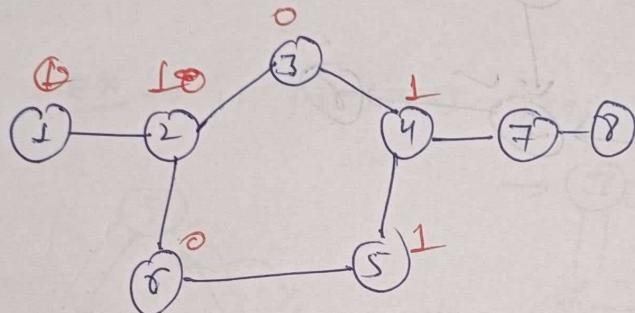

and graph having even length cycle

are always the Bipartite graph

\Rightarrow The graph which have odd length cycle are not Bipartite graph.

BFS

initially put node=1 into queue
& assign $\text{color}[1] = 0$

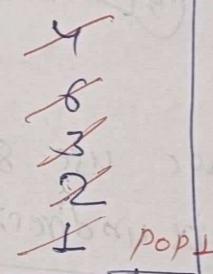

\rightarrow Now iterate on queue

$$\text{node} = \text{q.front}() = 1$$

$$\text{adj}(1) = \{2\}$$

$$\text{color}[2] = -1$$

$$\text{color}[2] = !\text{color}[1]$$

queue

$$\rightarrow \text{node} = 2 \quad \text{adj}(2) = \{3, 6\} \quad 3 = -1 \quad \Rightarrow \quad 3 = !\text{color}(2) = 0$$

$$6 = -1 \quad \Rightarrow \quad 6 = !\text{color}[2] = 0$$

$$\rightarrow \text{node} = 3 \rightarrow \text{adj}(3) = \{2, 4\} \rightarrow 2 \rightarrow 1 \& 3 \rightarrow 0 \quad \checkmark$$

$$4 \rightarrow -1 \& 3 \rightarrow 0 \Rightarrow 4 = 0$$

$$\rightarrow \text{node} = 6 \rightarrow \text{adj}(6) = \{2, 5\} \rightarrow 2 \rightarrow 0 \& 6 \rightarrow 0 \quad \checkmark$$

$$5 \rightarrow -1 \& 6 \rightarrow 0 \rightarrow 5 = 1$$

$$\rightarrow \text{node} = 4 \rightarrow \text{adj}(4) = \{5, 7\} \rightarrow 5 \rightarrow 1 \& 4 \rightarrow 1 \quad \text{Not Bipartite}$$

Not Bipartite

	1	2	3	4	5	6	7	8
$\text{color} \rightarrow$	0	1	-1	-1	-1	-1	-1	-1

-1 \leftarrow not coloured yet

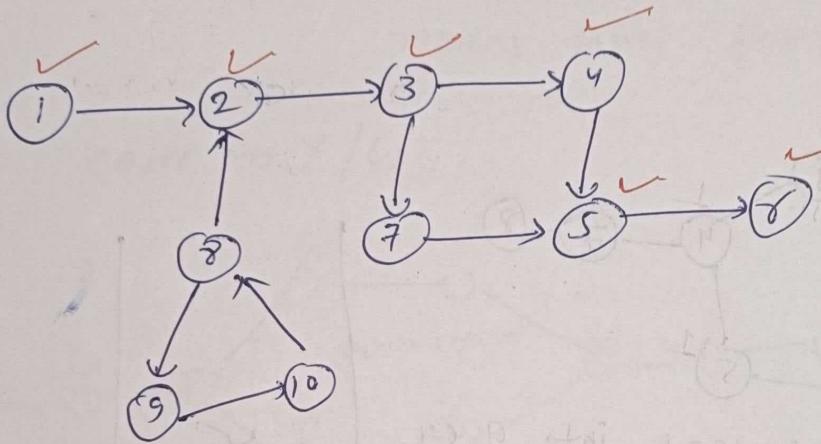

$$\text{color} = 0 / 1$$

$$\text{T.C.} \Rightarrow O(n) + O(n+2E)$$

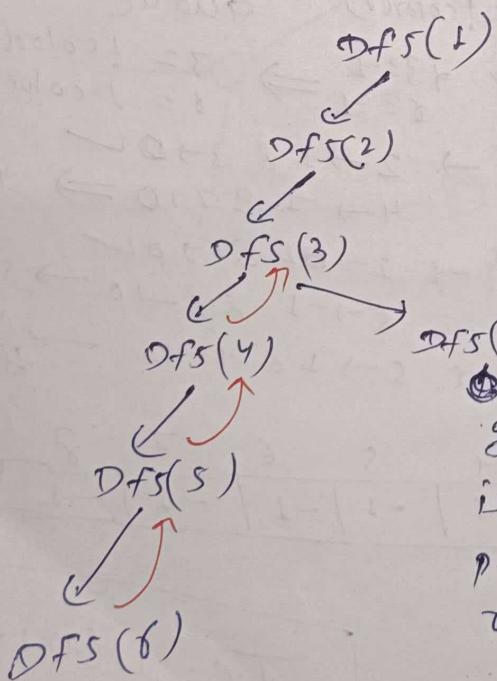

$$\text{S.C.} = O(n) + O(n)$$

Detect a Cycle in a Directed Graph

use DFS

Can we use same approach as detect cycle
in a undirected graph → No.

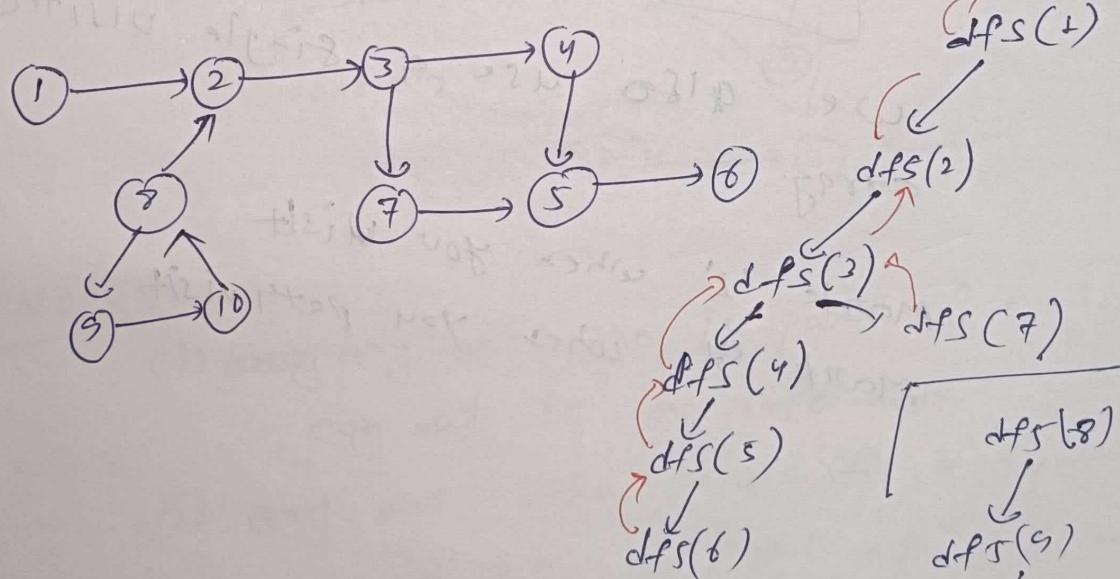

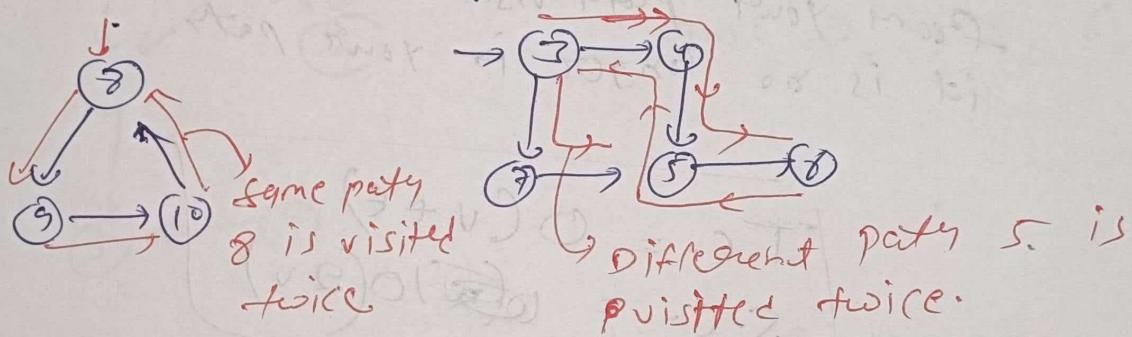

Now at 7 when we go for adjacent then 5 is visited & 6 not the parent of 7 so this will return a cycle as the above approach

Cycle in Directed graph → If on the same path we found a node that is previously visited

~~then we can say that~~ graph contains

ex → in previous graph.

vis →	0	1	0	1	0	1	0	1	0	1	0	1
	0	1	2	3	4	5	6	7	8	9	10	
pathvis →	0	1	0	1	0	1	0	1	0	1	0	1
	0	1	2	3	4	5	6	7	8	9	10	

8 ← visited & path visited

→ when you call dfs then mark visited that vertex & also path visited of that vertex.

And

when you come back from that node then you have to remove that node from your path visited vector bcz it is no longer in your path.

$$T.C. = O(v + e)$$

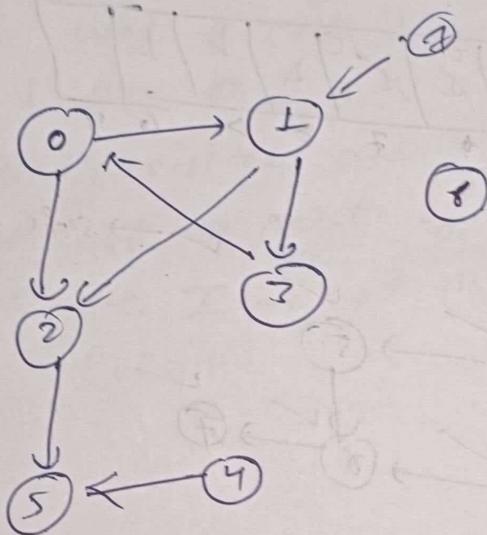

$$S.C. = \cancel{O(v)} O(2^v)$$

we also use a single visited array

Mark '1' when you visit
Mark '2' when you path visit

Eventual Safe path

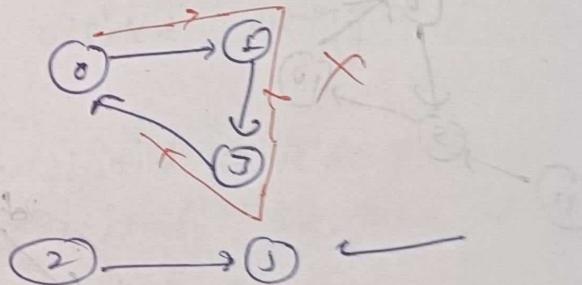

Safe node \rightarrow every path from that node ends up at terminal node

ans = 2, 4, 5, 6

check for $node = 0$

$node > 2$

Note -

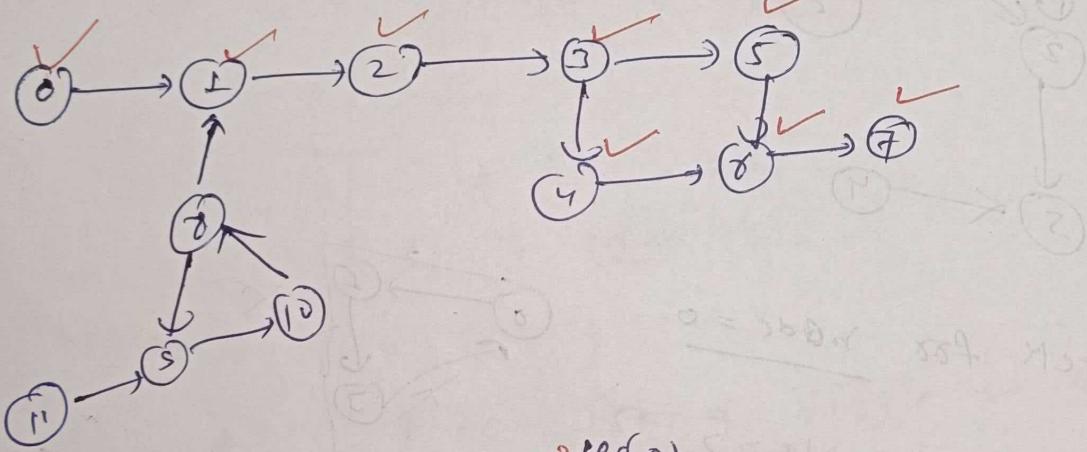

- ~~Any~~ any one who is part of cycle can not be a safe node
- Any one who leads to a cycle also cannot be part of safe node
like $\rightarrow 7$

Vis-

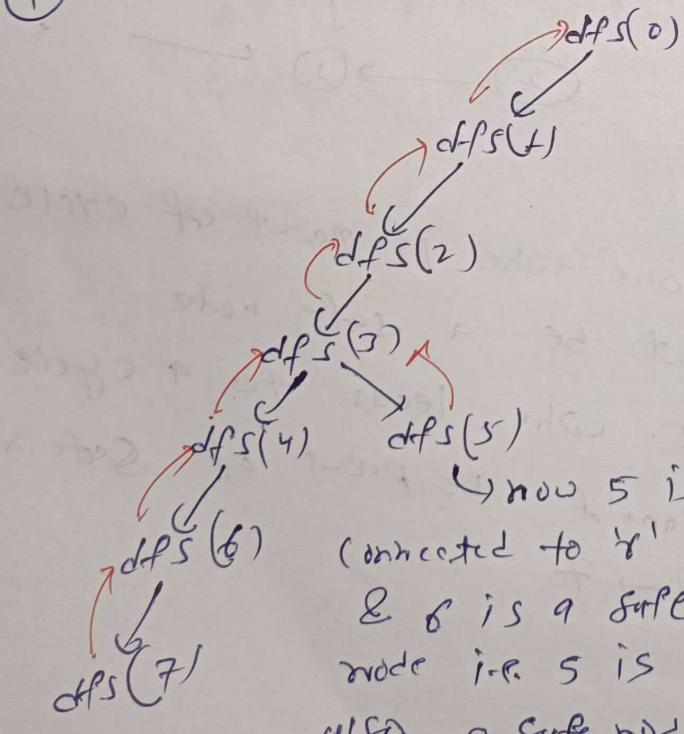

L	L	L	L	S	S	L	S	L	L	L
0	1	2	3	4	5	6	7	8	9	10 11

pathvis:

0	0	0	0	0	0	0	0	0	0	0
1	1	2	3	4	5	6	7	8	9	10 11

✓ → safe node

node 5 is
connected to 8
& 8 is a safe
node i.e. 5 is
also a safe node

dfs(8)

dfs(1)

when 8 calls 1

I say b I am

already visited add

I am not a part of
cycle i.e. I am not path
visited

dfs(9)

dfs(10)

8 is
visited &
also path
visited

i.e. cycle i.e.
return without

changing the path
visited every

dfs(11)

dfs(8) ← 8 is visited & also path
visited i.e. it is not
a safe node.
